#### LECTURE NO. 14

5.1 Sequences

Wright State University

# Why do we study squences and series?

- How would you calculate  $e^2$ ?
- Inside a calculator,  $e^x$  is represented as follows:

$$e^{x} = 1 + x + \frac{x^{2}}{2!} + \frac{x^{3}}{3!} + \frac{x^{4}}{4!} + \cdots$$

- So  $e^2 = 1 + 2 + \frac{2^2}{2!} + \frac{2^3}{3!} + \frac{2^4}{4!} + \cdots$ ; the calculator will perform the computation up to a certain number of decimal places.
- Recall that  $\int e^{t^2} dt$  is impossible to do!
- However,  $e^{t^2}$  can be written as an infinite sum of "good functions":

$$e^{t^2} = 1 + t^2 + \frac{t^4}{2!} + \frac{t^6}{3!} + \frac{t^8}{4!} + \cdots$$

nces LECTURE NO. 14

## What is a sequence?

• A sequence  $\{a_n\}$  is a set of numbers listed in order:

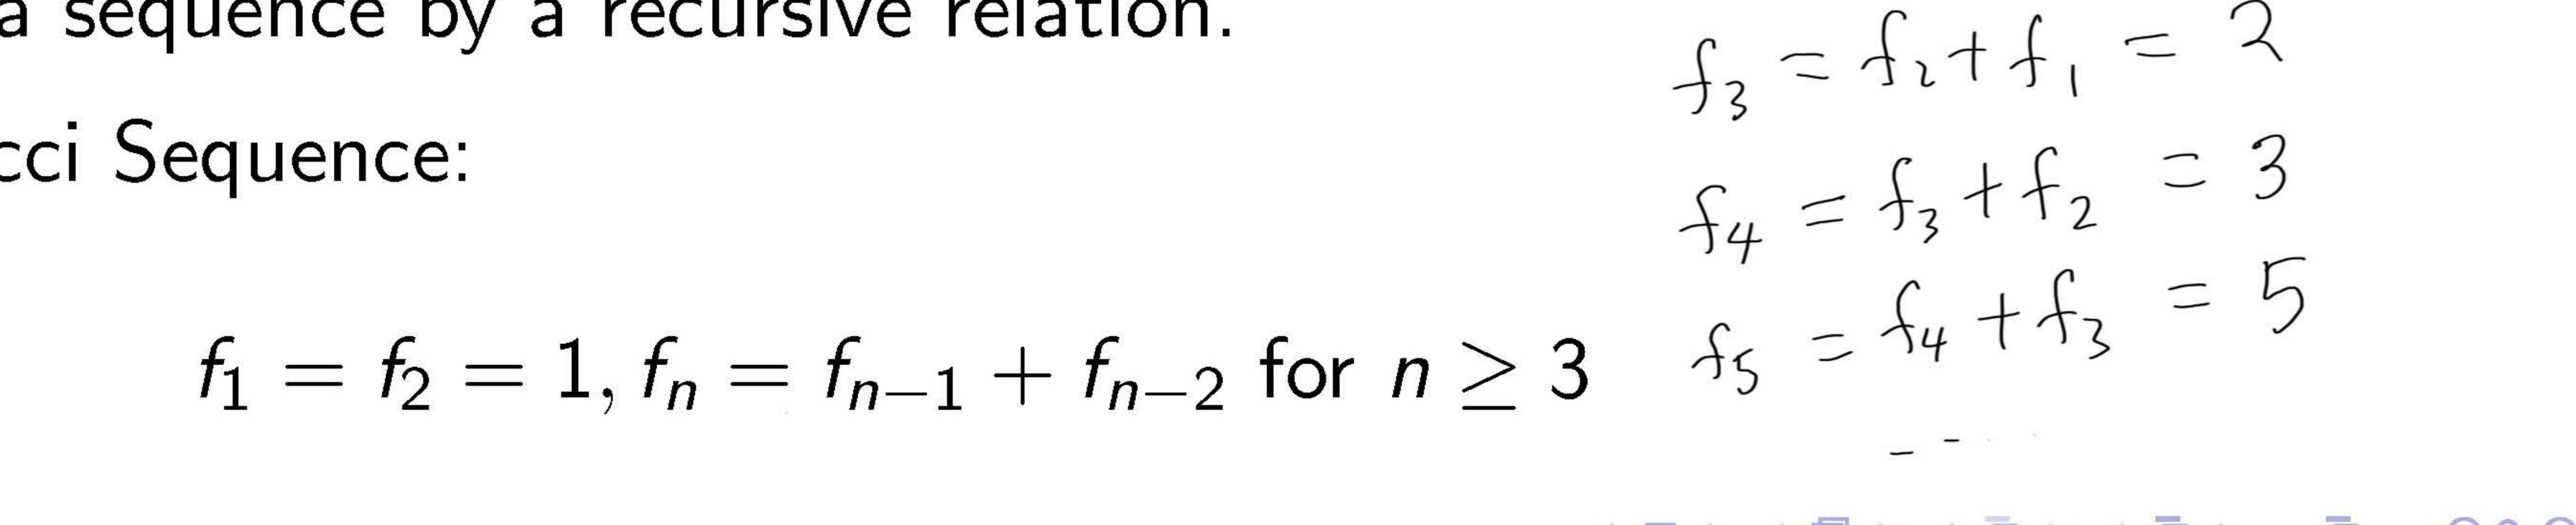

$$a_1, a_2, a_3, \cdots, a_n, \cdots$$

• We can write a sequence by listing the numbers:

$$1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \cdots$$

- Or we can give a general formula:  $a_n = 2^n, n \ge 0$  : 1, 2, 4, 8, 16, 32, ----
- We may also define a sequence by a recursive relation.
- The Famous Fibonacci Sequence:

$$f_1 = f_2 = 1, f_n = f_{n-1} + f_{n-2}$$
 for  $n \ge 3$ 

# Arithmetic Sequence and Geometric Sequence

- In an arithmetic sequence, the difference between every pair of consecutive terms is the same.
- An arithmetic sequence  $\{a_n\}$ : 2, 7, 12, 17, 22, 27, 32, · · ·
- General Formula:  $a_n = 2 + 5(n-1) = 5n 3, n \ge 1$ .
- In a geometric sequence, the ratio between every pair of consecutive terms is the same.
- A geometric sequence  $\{b_n\}$ :  $3, -\frac{3}{2}, \frac{3}{4}, -\frac{3}{8}, \frac{3}{16}, \cdots$
- General Formula:  $b_n = 3 \cdot (-\frac{1}{2})^{n-1}, n \ge 1$ .

# Finding Explicit Formulas

• 
$$-\frac{1}{2}, \frac{2}{3}, -\frac{3}{4}, \frac{4}{5}, -\frac{5}{6}, \dots$$
 $N = 1, 2, 3, 4, 5, -\frac{1}{2}$ 
 $N = \frac{1}{2}, \frac{2}{3}, -\frac{3}{4}, \frac{4}{5}, -\frac{5}{6}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, -\frac{5}{6}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, -\frac{5}{6}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, -\frac{5}{6}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{2}{3}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{5}, \frac{4}{5}, \dots$ 
 $N = \frac{1}{2}, \frac{4}{3}, \frac{4}{3}, \frac{4}{5}, \dots$ 

• 
$$\frac{3}{4}$$
,  $\frac{9}{7}$ ,  $\frac{27}{10}$ ,  $\frac{81}{13}$ ,  $\frac{243}{16}$ , ...

 $N: Geometric Sequence$ 
 $N: Geometric Sequence$ 

## Convergence of a sequence

A sequence is convergent if

$$\lim_{n\to\infty} a_n = \text{a number};$$

otherwise, it is divergent.

- Three ways to find  $\lim_{n\to\infty} a_n$ :
  - Use Algebra: ex.  $a_n = \cos(\frac{2}{3n+1})$

$$\lim_{n\to\infty} a_n = \lim_{n\to\infty} \cos(\frac{2}{3n+1}) = \cos(0) =$$

- Use L'Hôpital's Rule
- Use Squeeze Theorem

$$b_{n} = \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} b_{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} b_{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} b_{n} = \lim_{n \to \infty} b_{n} + h$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

$$\lim_{n \to \infty} \frac{n^{2}+1}{n} = \lim_{n \to \infty} \frac{n^{2}+1}{2n+3}$$

Use LHR to decide if the sequence  $a_n = \frac{2^n}{n^2}$  is convergent.

We need to find 
$$\lim_{N\to\infty} \frac{2^n}{N^2} = \lim_{N\to\infty} \frac{2^{\times}}{N^2} = \lim_{N\to\infty} \frac{2^{\times}}{N^2} = \lim_{N\to\infty} \frac{2^{\times} \ln 2}{N^2} = \lim_{N\to\infty} \frac{2^{\times} \ln 2}{N^2}$$

ences LECTURE NO. 14

# Use Squeeze Theorem to decide if $b_n = \frac{\sin n}{n}$ is convergent.

$$\lim_{n\to\infty} b_n = \lim_{n\to\infty} \frac{\sin n}{n} = 0$$

$$\lim_{n\to\infty} \int \frac{\sin n}{n} < \frac{1}{n}$$

$$\lim_{n\to\infty} \int \frac{\sin n}{n} = 0$$

the segmence 
$$b_n = \frac{\sin n}{n}$$
 is assured gent to  $0$ .

#### Other Properties of a Sequence

- A sequence  $\{a_n\}$  is increasing if  $a_n \leq a_{n+1}$  for all n.
- Example of an increasing sequence:  $a_n = \frac{n}{n+1}, n \ge 1$
- A sequence  $\{a_n\}$  is decreasing if  $a_n \ge a_{n+1}$  for all n.
- Example of a decreasing sequence:  $a_n = \frac{1}{n}, n \ge 1$
- A sequence  $\{a_n\}$  is bounded if there are real numbers m and M such that  $m \le a_n \le M$  for all n.
- Example of a bounded sequence:  $a_n = (-1)^n \frac{2n}{2n+1}, n \ge 1$

•

$$-1 \leq a_n \leq 1$$
